

How state government utilized PeopleSoft Testing Framework to reduce testing time by 83%

Challenge

A large government entity was facing significant drops in internal productivity during their PeopleSoft release cycles because of a manual testing process that was being employed. This process required 50 internal team members to conduct testing for end-to-end processes over a three-month period each time PeopleSoft issued a new release.

Solution

WorkStream Technology organized a team of 5 to manage and build test scripts for more than 500 end-to-end processes. The team of 5 had accountability to specific business processes and manage the creation of these scripts to a tight timeline, ensuring this project stayed on schedule and budget.

Results

Following the completion of this project, the client was able to replact their manual 3 month testing process with an automatic solution that can now be **completed in under 12 hours** and managed with minimal internal disruption. Today this client benefits from greatly reduced PUM implementations (from 4 months previously, down to 2 months).
